KU

Where is Kansas?

Geography Lesson

Resilience and Heterogeneity

Outline

- Resilience and heterogeneity
- Example realms
 - WDTN
 - highly mobile airborne ad-hoc networking
- Evaluation methodology
 - simulation
 - experimentation

Resilience and Heterogeneity

Introduction and Motivation

- Network resilience increasingly important
 - as we increasingly rely on the Global Internet
 - increasingly a target of attack
- Heterogeneity
 - new application domains (mobility, sensors, etc.)
 - new network technologies (wireless, etc.)
- Internet architecture strained by both

ResiliNets Strategy

$D^2R^2 + DR$

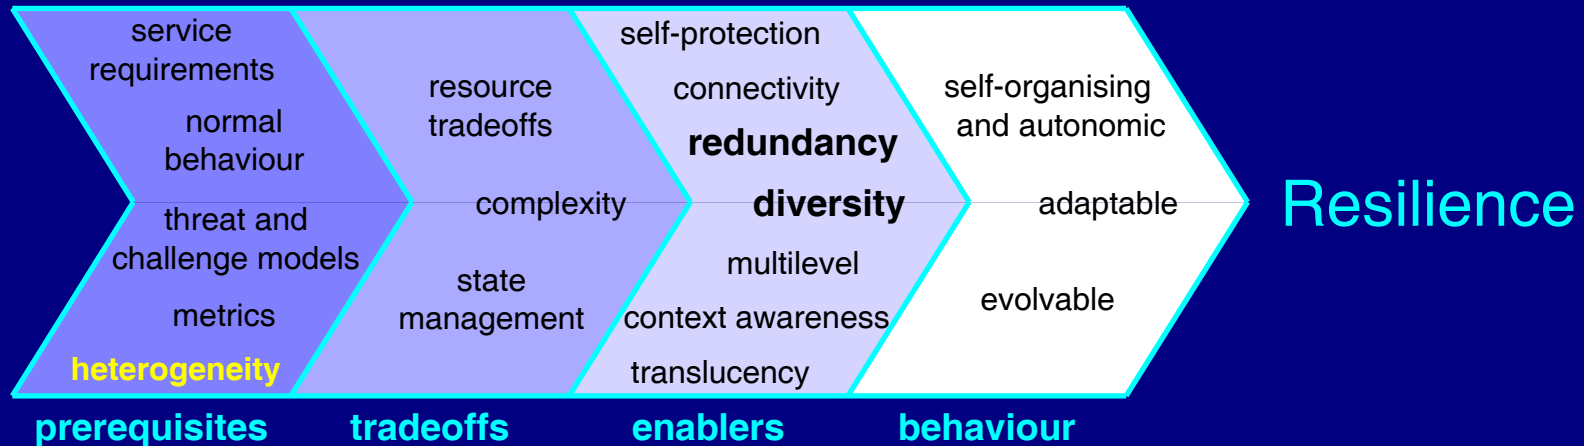

- Real time control loop: D^2R^2
 - defend
 - passive
 - active
 - detect
 - remediate
 - recover
- Background loop: DR
 - diagnose
 - refine

ResiliNets Principles

High Level Grouping

- Prerequisites: to understand and define resilience
- Tradeoffs: recognise and organise complexity
- Enablers: architecture and mechanisms for resilience
- Behaviour: require significant complexity to operate

End-to-End Communication

Redundancy and Diversity

- E2E transport over multiple diverse paths
 - that have minimal (if any) shared fate
- Diversity in
 - service provider: resilience to contract and peering disputes (e.g. Cogent vs. Level3)
 - underlying technology: resilience to medium challenge
 - e.g. weather disruption of wireless mesh links
 - path geography: resilience to natural disaster and attacks
 - e.g. Baltimore tunnel fire, Hinsdale central office fire
 - fault tolerance necessary but not sufficient for survivability
- Diversity at *all layers*

End-to-End Communication

Example Scenario

- Realm path choices explicitly available to end user
 - spreading (e.g. erasure coding) or hot standby
 - service tradeoffs: optical when available, fail-over to wireless
 - cheapest path under dynamic pricing

End-to-End Communication

Knobs and Dials

Knobs ↓	Layer	Dials ↑
service class reliability mode	application	service characteristics
PoMo knobs, FD, motiv.	E2E transport	path char., geography
realm oper. parameters	PoMo internetwork	realm characteristics
link type and coding error control type/strength	network realm	link characteristics
	HBH link	

- Knobs and dials between upper layers and PoMo
 - support heterogeneous subnetworks
 - e.g. lossy wireless vs. reliable wired
 - explicit signalling of path diversity and multipath
 - geographic location of realms, nodes, channels

Resilience and Heterogeneity

Weather Disruption-Tolerant Networking

- Resilience strategy and principles
- Postmodern Internet Heterogeneity
- Example realms
 - WDTN
 - highly mobile airborne ad-hoc networking
- Evaluation Methodology
 - simulation
 - experimentation

Millimeter-Wave Mesh Networks Architecture

- Mesh architecture
 - high degree of connectivity
 - alternate diverse paths
 - severely attenuated mm wave
 - alternate mm links
 - alternate lower-freq. RF
 - fiber bypass (competitor)

- Approach

- route around failures
 - *before* they occur
- avoid high error links
- P-WARP and XL-OSPF routing algorithms

Simulations

Observed Storm in Northeast Kansas

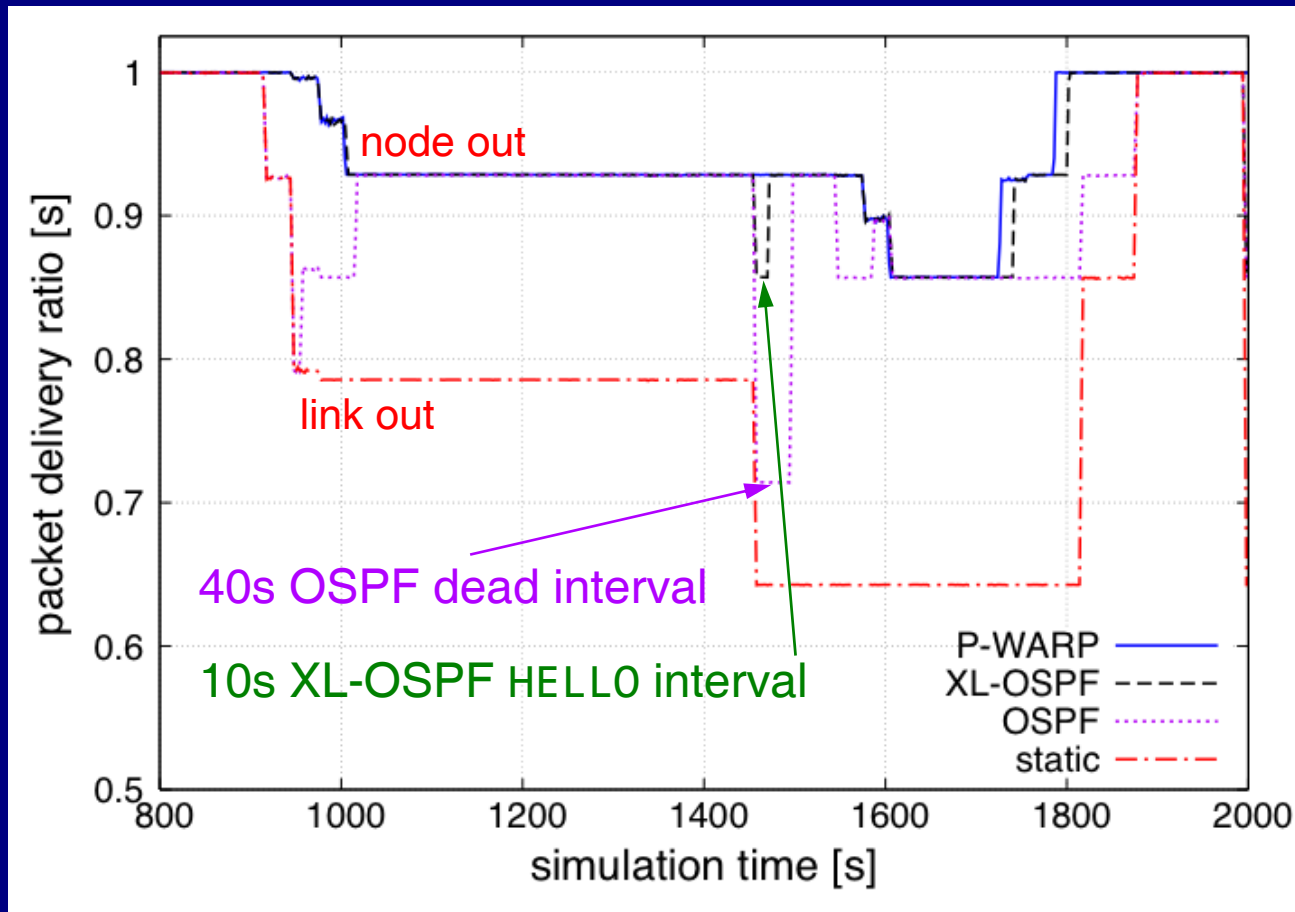

- Millimeter-wave grid location
 - 38.8621N, 95.3793W
- Storm observed at:
 - 20:39:26Z 30 Sep 2008

Observed Storm

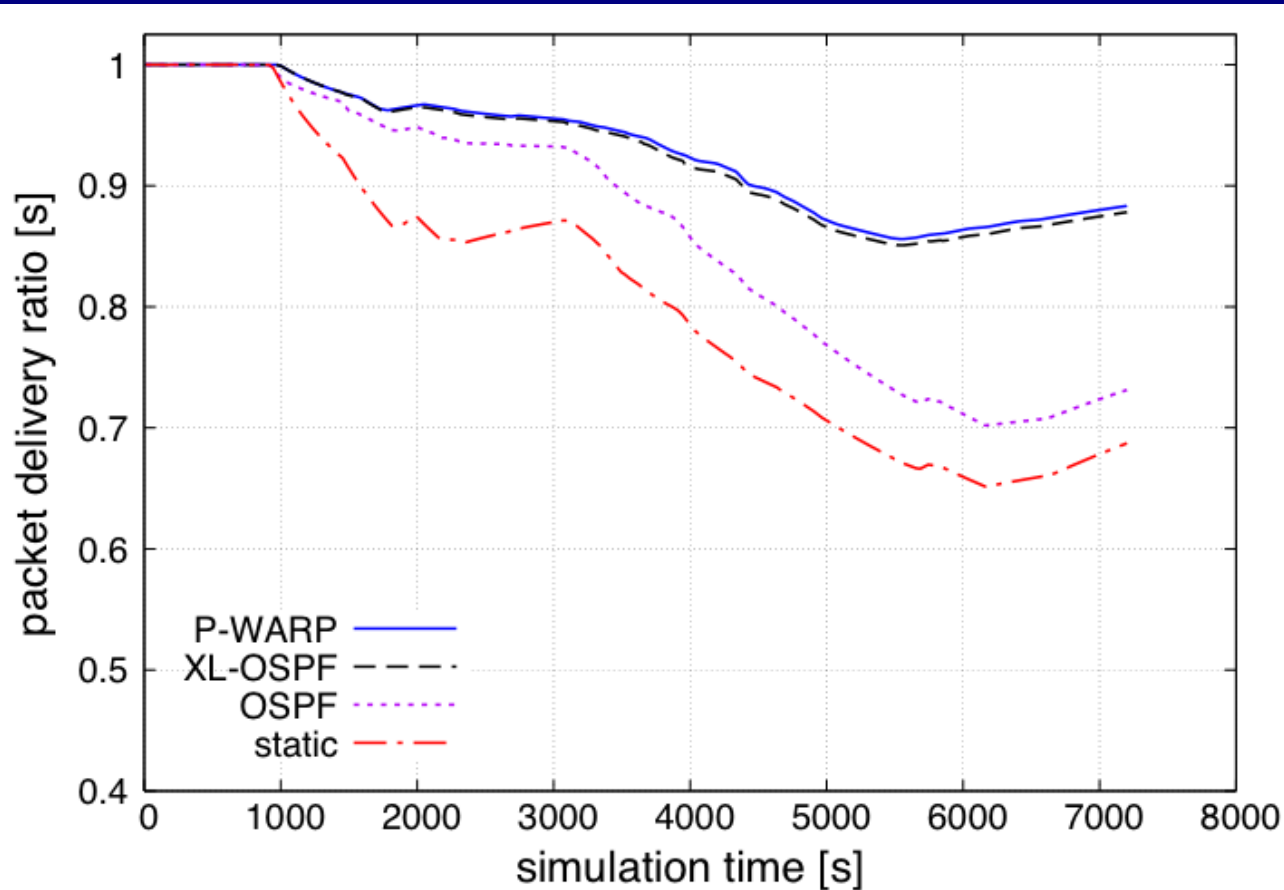

Performance Analysis: Packet Loss

Observed Storm

Performance Analysis: Cumulative Loss

Resilience and Heterogeneity

Highly-Mobile Airborne Ad Hoc Networking

- Resilience strategy and principles
- Postmodern Internet Heterogeneity
- Example realms
 - WDTN
 - highly-mobile airborne ad hoc networking
- Evaluation Methodology
 - simulation
 - experimentation

Airborne Telemetry Networking

Scenario and Environment

- Very high relative velocity
 - Mach 7 ≈ 10 s contact
 - dynamic topology
- Communication channels
 - limited spectrum
 - asymmetric links
 - data down omni
 - C&C up directional
- Multihop
 - among TAs
 - through relay nodes

Airborne Telemetry Networking

Link Stability and Contact Durations

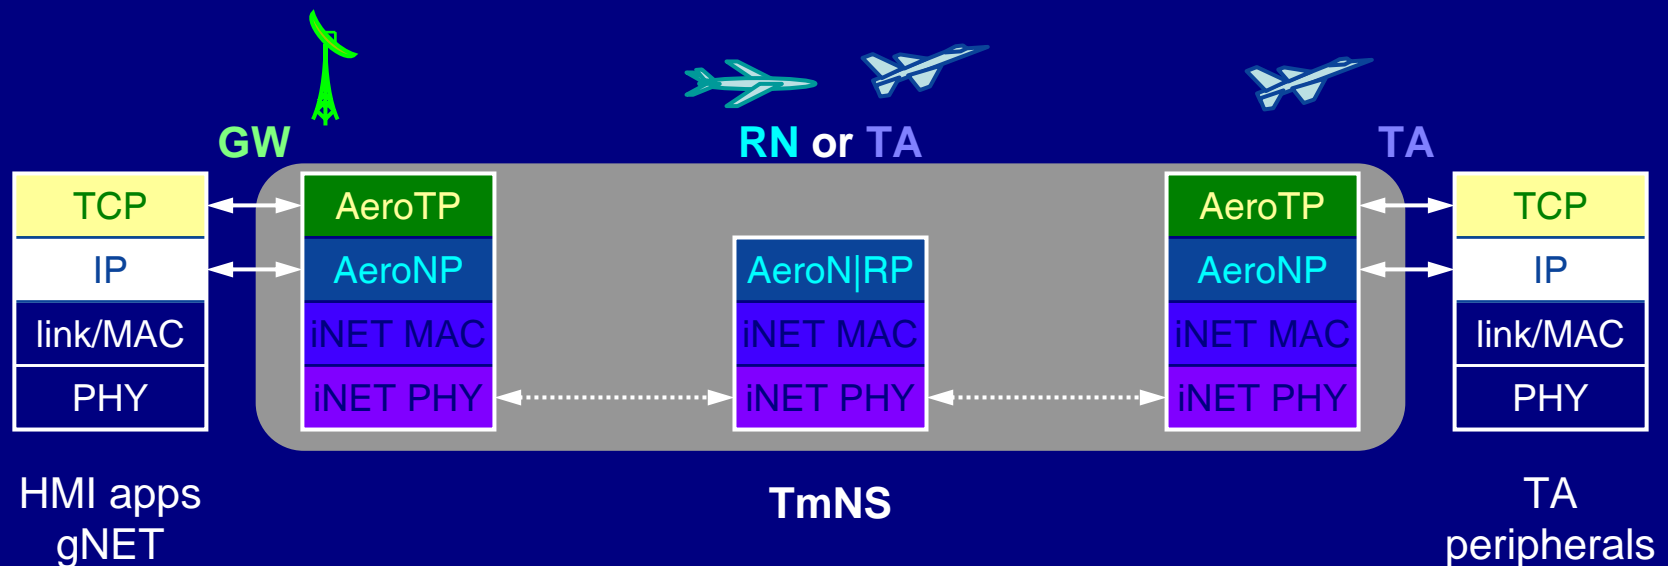

Scenario	Transmit Range [nmi]	Relative Velocity	Contact Duration [sec]
Single-Hop Best Case			
GS – TA	140	400 knots	2520
TA – TA	15	800 knots	135
Single-Hop Worst Case			
GS – TA	100	Mach 3.5	300
TA – TA	10	Mach 7.0	15

- Multihop case significantly harder
 - probability of stable end-to-end path very low

Airborne Network Protocol Suite

Protocol Stack and Interoperability

- **AeroTP:** TCP-friendly transport
- **AeroNP:** IP-compatible forwarding
- **AeroRP:** routing

AeroTP

Connection and Flow Management

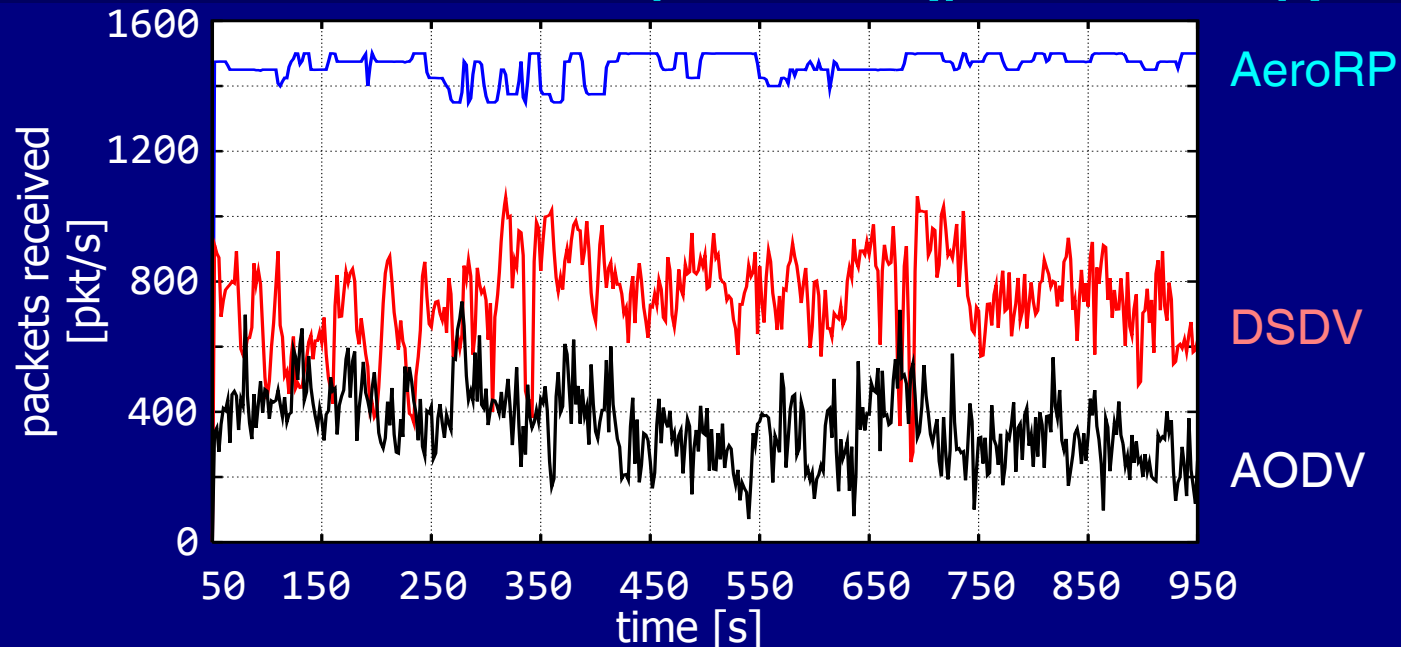

- AeroTP is *opportunistic*: data overlaps control
 - final **ACK** of TCP 3WH at GW initiates AeroTP **ASYN**
 - data follows immediately without 3-way handshake in TmNS
 - optional **AACK** depending on mode; loss may retrigger **ASYN**

AeroRP

Performance Comparison (preliminary)

- 60-node ns-2 simulation in 150×150 km² test range
- TA tx range = 15 nmi; $v = [200 \text{ knot}, \text{Mach } 3.5]$
- CBR traffic = 200 kb/s per TA [MILCOM 2008]

Resilience and Heterogeneity

Evaluation Methodology: Simulation

- Resilience strategy and principles
- Postmodern Internet Heterogeneity
- Example realms
 - WDTN
 - highly mobile airborne ad-hoc networking
- Evaluation methodology
 - simulation
 - experimentation

Evaluation Methodology

Flexible and Realistic Topology Generation

- KU-LoCGen
 - evaluation of PoMo mechanisms
 - network engineering for resilience
- Level 1: **backbone realms**
 - nodes distributed based on location constraints
 - links generated using various models under cost constraints
- Level 2: **access network realms**
 - distributed around backbone nodes
 - access network connectivity: ring, star, mesh
- Level 3: **subscribers**
 - distributed around access network node

Evaluation Methodology

Challenge Simulation Module

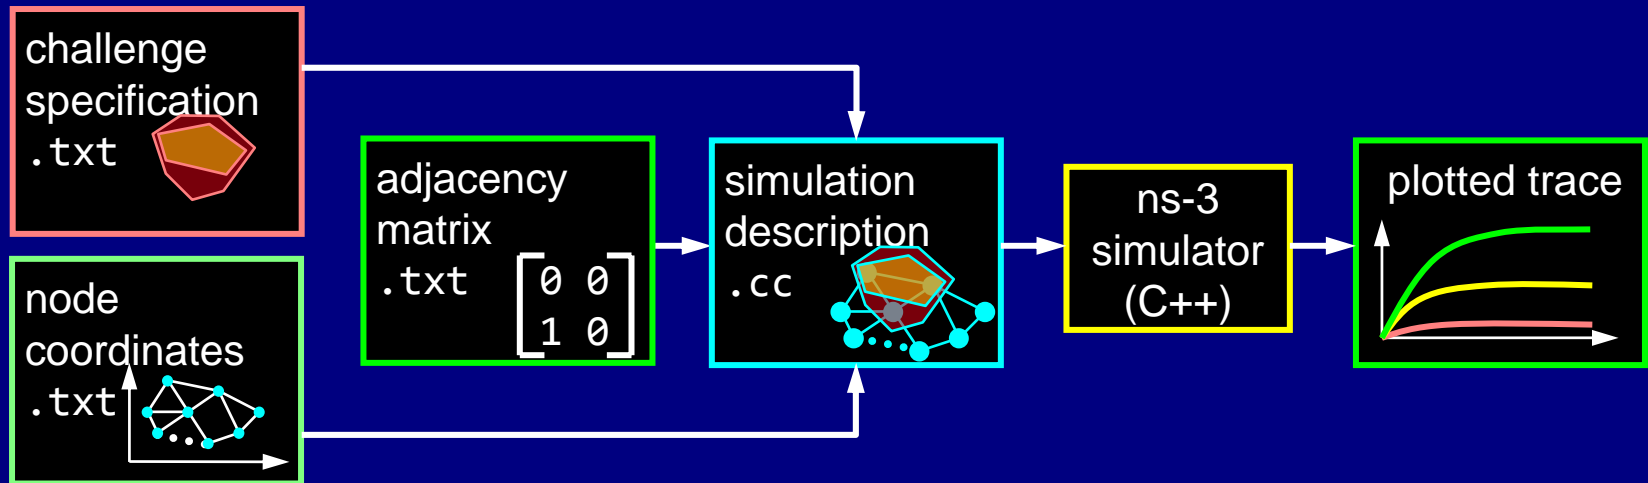

- Separate challenge from network simulation
- Simulate challenges to any network over time interval
 - natural disaster: polygon destroys network infrastructure
 - attack: {node|link} down, wireless link attenuated

Evaluation Methodology

Challenge Simulation Module

- KU-CSM Challenge Simulation Module

- challenge specification describes challenge scenario
- network coordinates provide node geo-locations
- adjacency matrix specifies link connectivity
- input to conventional ns-3 simulation run
- generates trace to plot results

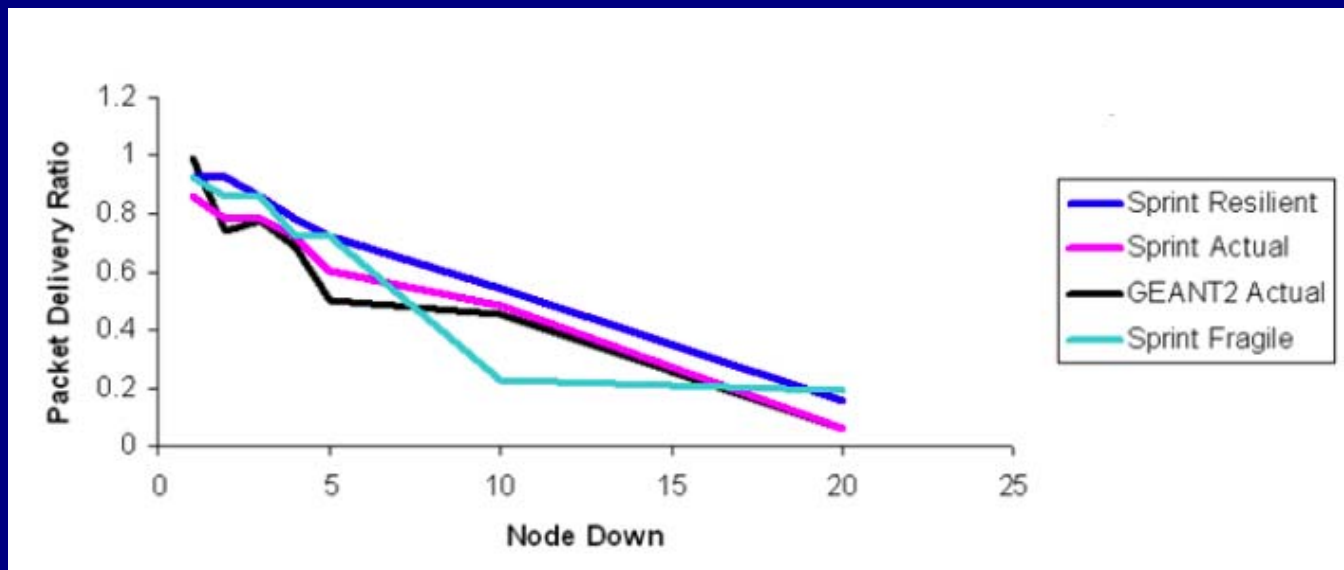

KU-LoCGen

Evaluation Methodology

Example: Resilience to Multiple Node Failures

- Example (and *very preliminary* results)
 - relationship of packet delivery ratio to multiple node failures
 - synthetic Sprint topologies generated by KU-LoCGen

Resilience State Space

Operational Resilience

- Operational resilience
 - minimal degradation
 - in the face of challenges
- Resilience state
 - remains in normal operation

Operational State N		
Normal Operation	Partially Degraded	Severely Degraded
S		

Resilience State Space

Service Resilience

- Service resilience
 - acceptable service
 - in the face of degraded operation
- Resilience state
 - remains in acceptable service

Resilience State Space

Resilience Trajectories

- Choose scenario
 - network
 - application
- Metrics
 - choose
 - aggregate
- Observe
 - under challenge

\mathbb{P} [delay, pkt delivery ratio]

Unacceptable
 $p_1 > 10 \text{ sec}$
 $p_2 > 0.85$

Impaired
 $p_1 < 10 \text{ sec}$
 $p_2 > 0.50$

Acceptable
 $p_1 < 1 \text{ sec}$
 $p_2 < 0.50$

Normal
operation
 $n_1 \leq 1.5\rho_0$
 $n_2 \geq 3.0$

Partially
degraded
 $n_1 \leq 3\rho_0$
 $n_2 \geq 1.0$

Severely
degraded
 $n_1 > 3\rho_0$
 $n_2 < 1.0$

\mathbb{N} [load, node degree]

Resilience and Heterogeneity

Evaluation Methodology: Experimentation

- Resilience strategy and principles
- Postmodern Internet Heterogeneity
- Example realms
 - WDTN
 - highly mobile airborne ad-hoc networking
- Evaluation methodology
 - simulation
 - experimentation

GENI

Overview

- GENI: Global Environments for Network Innovation
 - funded by the US NSF
 - managed by the GPO (GENI Project Office – BBN)
- Goal: new experimental network infrastructure
- 1st solicitation: 29 projects funded
 - grouped into 5 control framework clusters (PlanetLab, ...)
 - including 2 regional testbeds (GpENI and MANFRED)
- 2nd solicitation closed and under final review
 - decisions hopefully by GEC5 (July in Seattle)
 - FIRE/GENI workshop in conjunction with GEC5

GpENI

Overview

- GpENI [dʒɛ'pi ni]
Great Plains Environment for Network Innovation
- Regional network part of Cluster B in GENI Spiral 1
 - exploiting new fiber infrastructure in KS, MO, and NE

GpENI

Project Goals

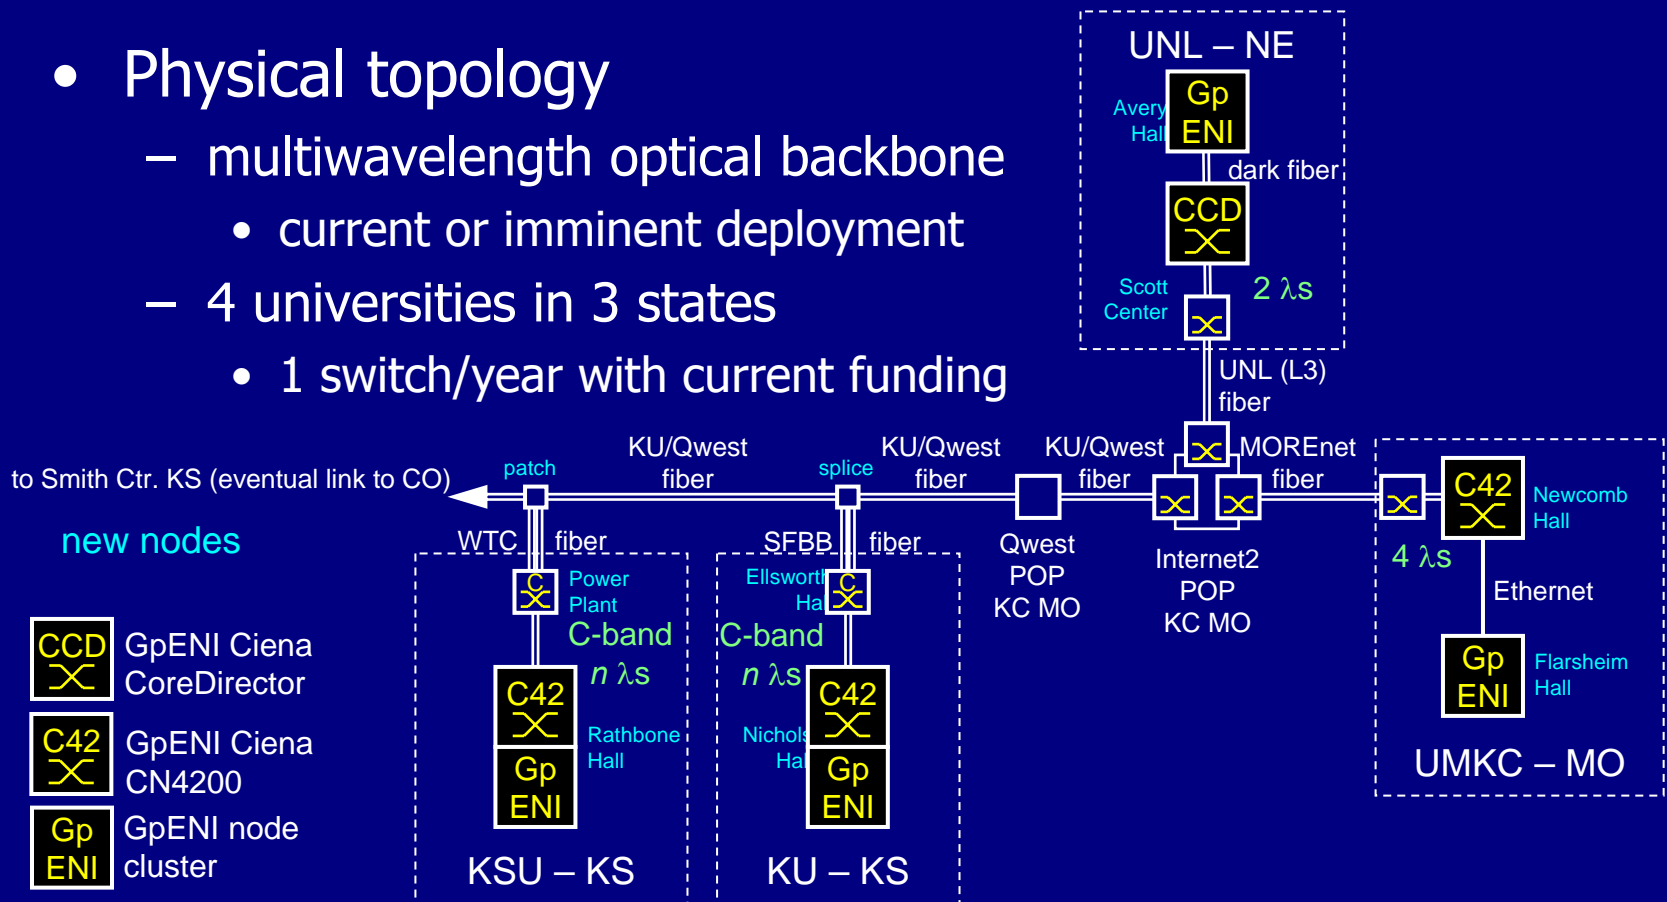

- Collaborative research infrastructure in Great Plains
- Flexible infrastructure to support GENI program
- Open environment for network research community
- Outreach to grow GpENI infrastructure
 - Great Plains region
 - internationally including EU FIRE

GpENI

Physical Topology and Network Infrastructure

- Physical topology
 - multiwavelength optical backbone
 - current or imminent deployment
 - 4 universities in 3 states
 - 1 switch/year with current funding

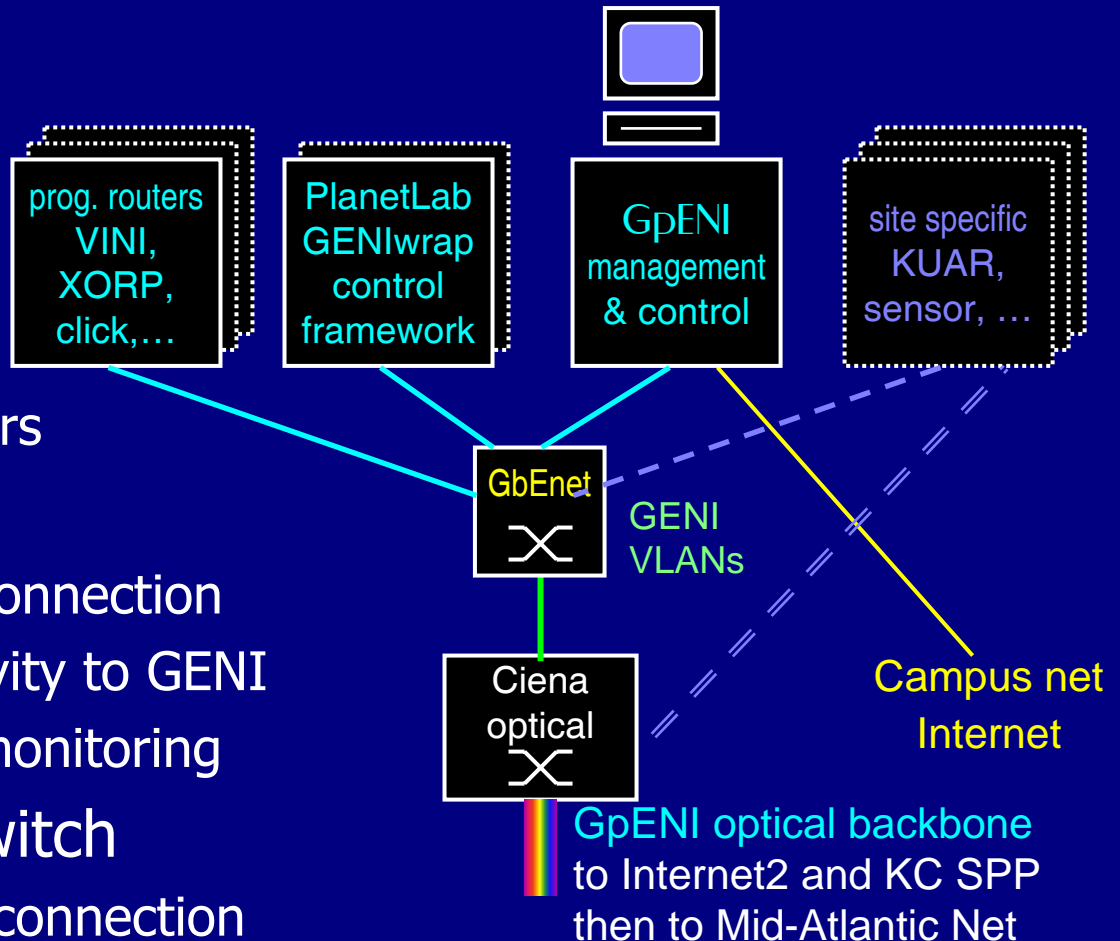

GpENI

Node Cluster

- GpENI cluster
- 5–10 PCs
 - GpENI mgt.
 - L4: PlanetLab
 - L3: prog. routers
- GbE switch
 - arbitrary interconnection
 - VLAN connectivity to GENI
 - SNMP cluster monitoring
- Ciena optical switch
 - L1 GpENI interconnection

GpENI

GPN Proposed Expansion

- Regional US GpENI partners
 - South Dakota: 3 universities
 - Missouri: 1 university
 - GMOC at Indiana University

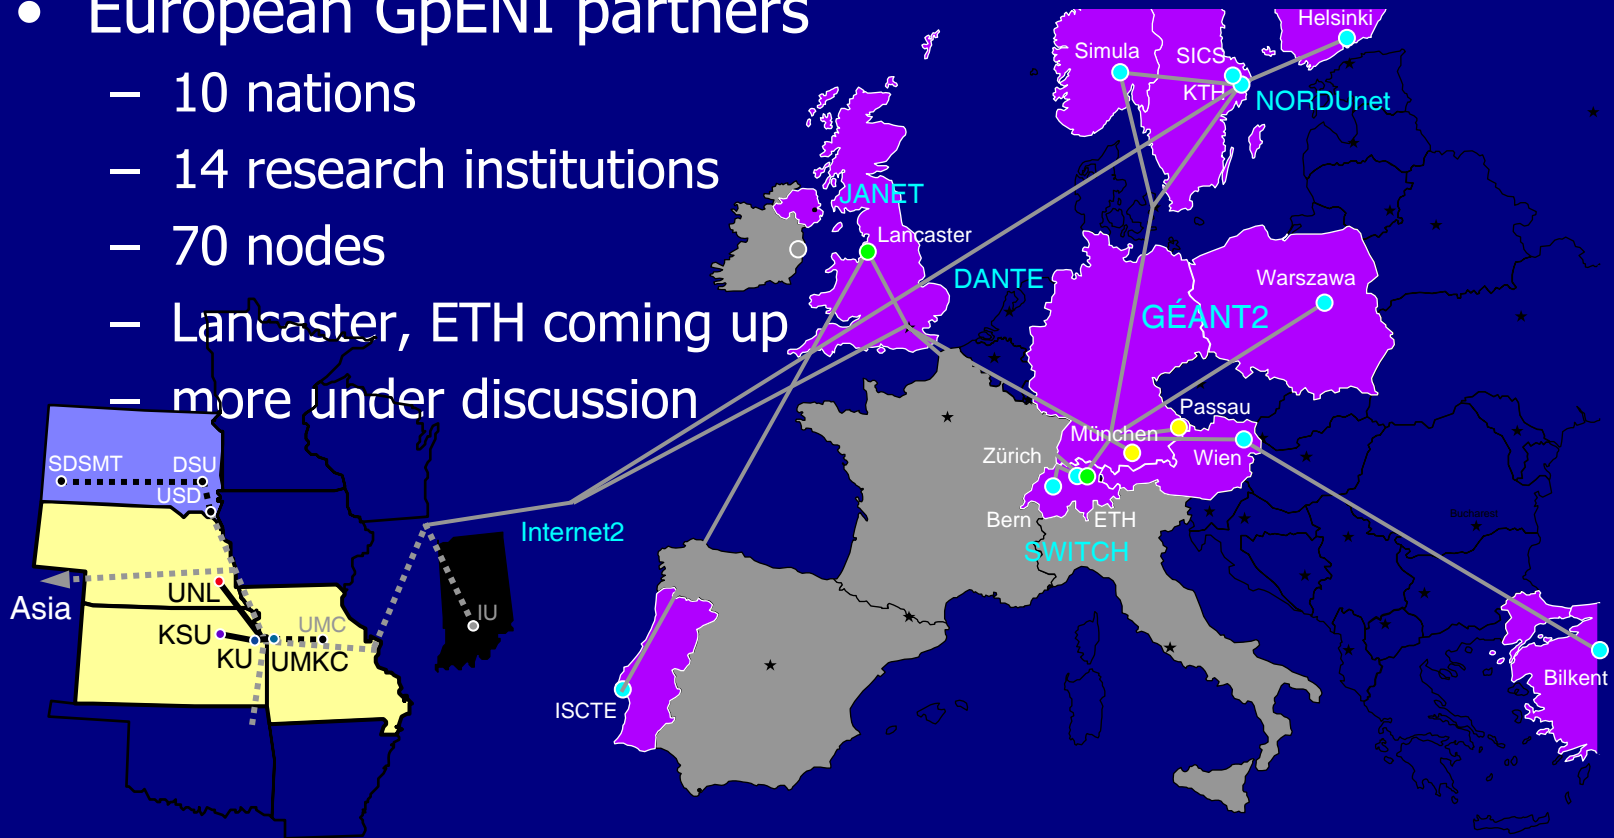

GpENI

European Proposed Expansion

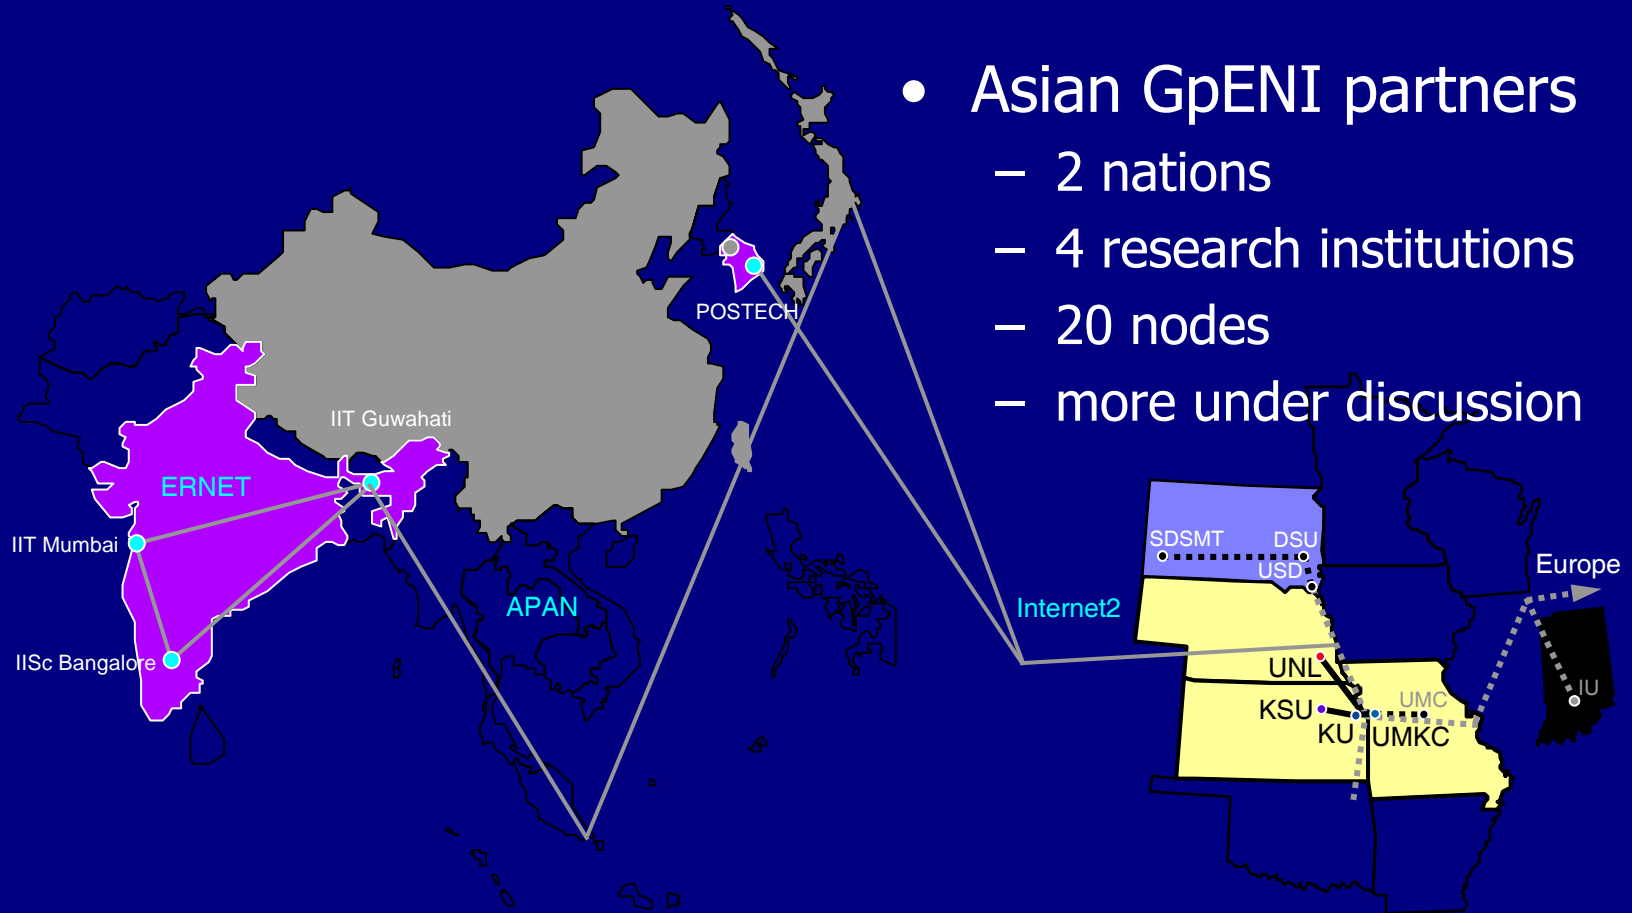

- European GpENI partners
 - 10 nations
 - 14 research institutions
 - 70 nodes
 - Lancaster, ETH coming up
 - more under discussion

GpENI

Asian Proposed Expansion

- Asian GpENI partners
 - 2 nations
 - 4 research institutions
 - 20 nodes
 - more under discussion

End
